

## Setting up MATLAB for TDA

Follow these steps to set up MATLAB:

1. Either run MATLAB in the TDA package directory, or make it the active directory in an already-running MATLAB session. This directory contains the **init.m** file.
2. At the MATLAB command prompt, execute the command

```
>> init
```

This will set up your environment.

3. That's it! You're ready to use a tutorial or get going on your own data.
